

# Updates to Loupedeck Software

## v. 4.2 supplement

### **Application Drop-down menu:**

When adding a new application:

- After modal opens, user needs to select which application he wants to “add” into the dropdown:
- The applications which are currently running are on top of the list (Windows feature only)
- Rest of the installed applications come after that.
- TIP! for the user: Run your application before adding it, so it can be found fast from the beginning of the list

Removing application from the application dropdown -list

- Remove the last profile and application will be automatically removed from the application drop-down menu
- Note: Integrated applications cannot be removed (e.g. Lightroom, Premiere Pro ..)

### **Profile drop-down menu:**

New Empty Profile

- Creates a profile without any action mapping, so that user can start mapping from the scratch (custom actions are also wiped for this profile).
- Created profile is automatically selected. NOTE: If you want to use some other profile with the target application, remember to select it from the drop down menu!

Add Default Profile:

- Creates a profile that has the default mapping (by Loupedeck) for corresponding (and supported) application. Note: Custom applications which are not supported by default do not have a default mapping.
- Created profile is automatically selected. NOTE: If you want to use some other profile with the target application, remember to select it from the drop down menu!

### **Custom Actions**

Custom Actions background image has purple stripes at the top and the bottom, but not purple background in the middle – this is to distinguish custom actions from plugin actions.

Custom Actions can now be created to the first level of “Custom Actions” main group (instead of forcing them all under an action group).

Icon editor:

- You can assign an image by dragging an image over the image preview.

General TIPS for user: (this might be mentioned there already, please check/search)

- Naming actions: Using \n in the naming will force the text into two rows when printed on touch button screen: example "This\nIs an\nAction" ->

**This**  
**Is an**  
**Action**

Combining two Custom Action Groups:

- Rename other group to have identical name as the other group = content of groups will be combined under one group

Custom Action's command line type: "Text"

- Can be used to run scripts, to print text, etc
- Following parameters can be utilized in the "Text"-type (parameters are not case sensitive):
  - o Current Date: %CurrentDate%
  - o Current Time: %CurrentTime%
  - o Loupedeck Software Version: %LoupedeckVersion%
  - o Operating System (OS) Version: %OsVersion%
  - o User Name (OS): %UserName%
  - o User Domain Name: %UserDomainName%
  - o Computer Name (ID Name): %MachineName%

## Custom Adjustments

Custom Adjustmen command lines can be swapped by pressing "Swap Order" button. This will swap the assigned functions on left rotation and right rotation.

Custom Actions can now be created to the first level of "Custom Actions" main group (instead of forcing them all under an action group).

Icon editor:

- You can assign an image by dragging an image over the image preview.

General TIPS for user: (this might be mentioned there already, please check/search)

- Naming actions: Using \n in the naming will force the text into two rows when printed on touch button screen: example "This\nIs an\nAction" ->

**This**  
**Is an**  
**Action**

Combining two Custom Action Groups:

- Rename other group to have identical name as the other group = content of groups will be combined under one group

## Creating pages

Tip! Page is formulated with a random name (e.g. Touch Page #2) and you can accept this quickly by pressing enter. Page name can be changed later to suit what has been assigned to the page.

- Created page is automatically selected and ready for mapping!

## Wheel Widgets

Assigning default rotation:

- First rotation adjustment assigned will be automatically assigned as default rotation
- If you assign only press actions to the wheel widget, you can assign default rotation separately.
- Note: Not all wheel widgets have a possibility to add default rotation (most of them do)

Swapping Assigned functions:

- You can swap the order of assigned functions by drag-and-dropping them within the wheel widgets function list.
- Drag-and-drop will swap functions, not change the order otherwise
  - o Note: On List wheel widget you change the order by drag-and-dropping an adjustment between any two adjustments.

## Creating Workspaces:

- Created workspace is automatically created and ready for mapping!
